Re: Dalf-1F Code Release (1.71)

This is to notify you that Embedded Electronics has recently released new code for the Dalf-1F Motor Controller Product. The release does not affect the board hardware. If you have an earlier release and are happy with it, you may want to just keep it.

In fact, the Version 1.71 code itself offers no advantages over the Version 1.70 code. There are no new features or bug fixes. This interim release offers a single benefit over the prior 1.70 release and only applies to your application if you are using the Dalf-1F Board as your platform for doing your own embedded code development.

Microchip has recently released a new tool suite that is incompatible with the development files that were included on the Version 1.70 CD. This only impacts users who would be using the latest Microchip tools to extend or modify the factory functionality using the Version 1.70 files (main.c, dalf.lib, ...) as a base. The new tools and the Version 1.70 files are incompatible. Please see the changelist.txt file for details.

Please contact Embedded Electronics, LLC to obtain a Version 1.71 Development CD if this affects you.
